ABSTRACT

Multilevel inverters are becoming more popular in the power conversion systems for high power and power quality demanding applications. The MATLAB based simulation on simulink platform is presented for three various topologies of Single Phase cascaded H-bridge Multilevel Inverter for 5, 7 and 9 levels. A detailed comparison of various Topologies is presented in the paper based on number of power devices used, Total Harmonic Distortion, average voltage stress, maximum voltage stress and utilization factor. The Topology I and Topology II are cheap and efficient because number of conducting power devices are less as compared to the conventional Topology.

KEYWORDS: Multilevel Inverter, Reduced Number of Switches, Reduced THD, Voltage Stress and Utilization Factor

INTRODUCTION

Multilevel inverters have more attention in the field of high voltage and medium power applications due to their advantages, such as low voltage stress on power semiconductor devices, low harmonic distortions, good electromagnetic compatibility, reduced switching losses and improved reliability on fault tolerance. Therefore, the multilevel inverters also have lower dv/dt ratio to prevent induction or discharge failures on the loads. Recently low voltage applications also has been studied to apply the multilevel inverters for high efficiency such as in the uninterrupted power supply (UPS) and power inverter for solar photovoltaic system (PV).

Different types of multilevel inverters for the conversion from DC to AC are available such as Neutral point clamped multilevel inverter (NPC-MLI), Flying capacitor multilevel inverter (FC-MLI) and Cascade H-Bridge multilevel inverter (CHB-MLI). Among them CHB-MLIs are mostly used for PV applications because each module of CHB-MLI requires separate DC sources which can be easily supplied by individual PV arrays. The number of levels of the output waveform can be increased by cascading the number of H-Bridge modules in series. If the number of level increases then total harmonic distortion (THD) also reduces.

CONVENTIONAL CASCADED H-BRIDGE MULTILEVEL INVERTER

Cascaded H-Bridge MLI is nothing but H-Bridges connected in a cascaded manner. By adding each H-Bridge module, we can increase the two levels in an output waveform. Normally for an single phase cascaded H-Bridge multilevel inverter, number of semi conductor switches required is $2(n-1)$, where n is the number of levels.

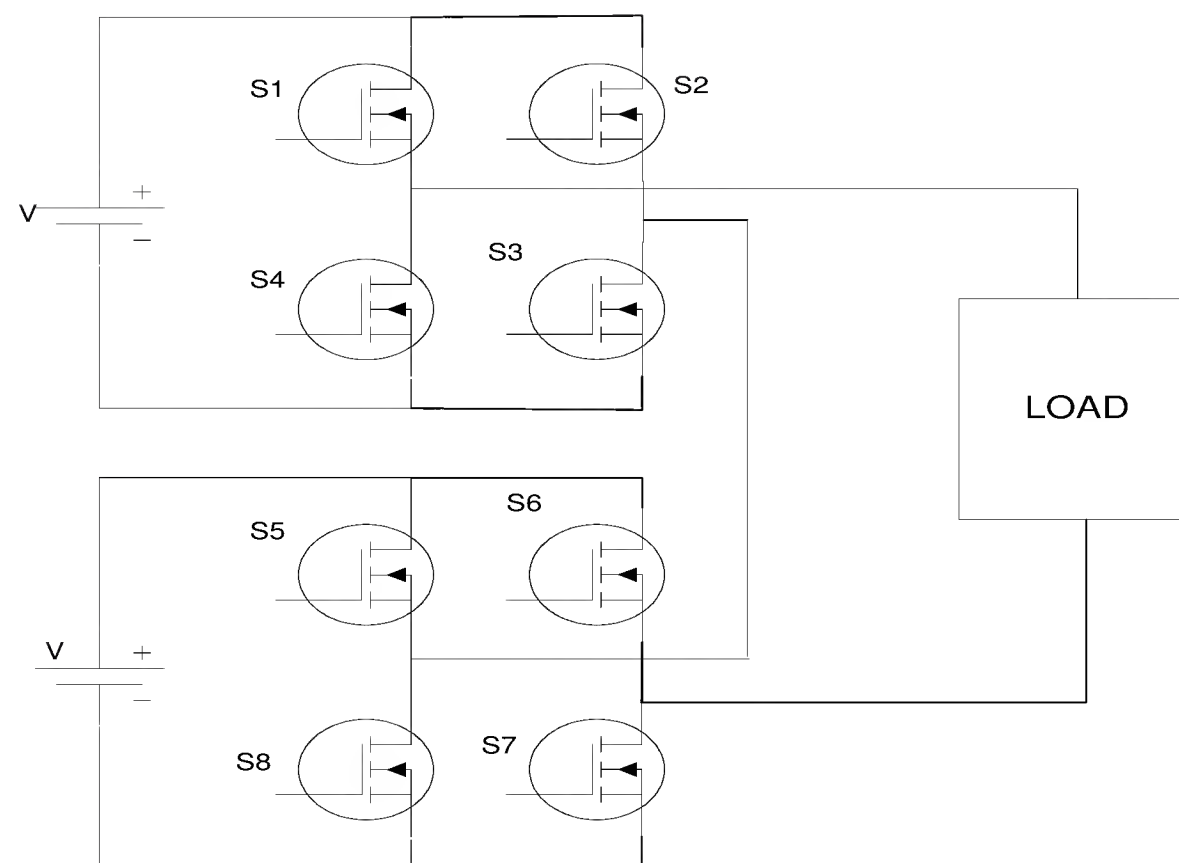

Figure 1: Conventional Five Level CHB-MLI

The figure 1 below shows the five level cascaded H-Bridge MLI where two modules are connected in cascaded manner. The switching of the eight switches is done in such a way (as tabulated in Table 1) so as to get an output voltage waveform as shown in figure 2, which is a five level output.

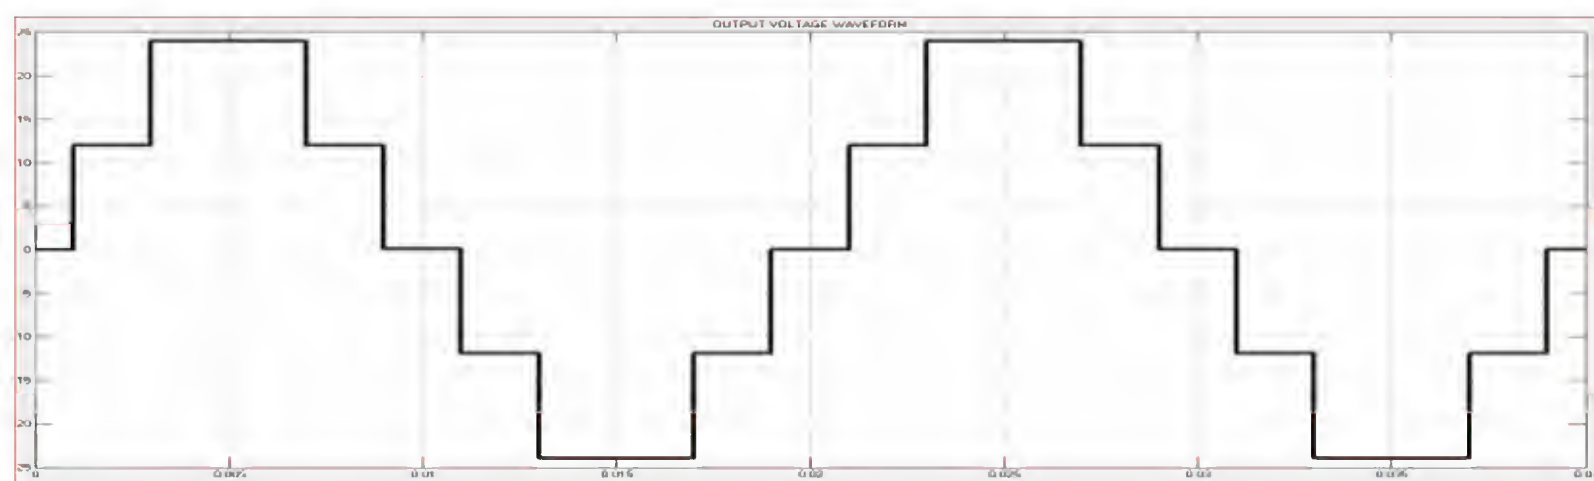

Figure 2: Output Voltage Waveform of Five Level CHB-MLI

Table 1: Switching Table of the Five Level Conventional CHB-MLI

S. No.	Stage	Status of the Power Device							
		S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	S ₇	S ₈
1.	2 nd (+) ^{ve}	1	0	1	0	1	0	1	0
2.	1 st (+) ^{ve}	1	0	1	0	0	0	0	0
3.	0	0	0	0	0	0	0	0	0
4.	1 st (-) ^{ve}	0	1	0	1	0	0	0	0
5.	2 nd (-) ^{ve}	0	1	0	1	0	1	0	1

Where, stage 2nd(+)^{ve}, 1st(+)^{ve}, 0, 1st(-)^{ve}, 2nd(-)^{ve} are the time intervals in which +2, +V, 0, -V and -2V output voltage is obtained respectively as shown in figure 2.

CASCADED H-BRIDGE MULTILEVEL INVERTER - TOPOLOGY I

In topology I the conventional CHB-MLI is modified with the objective to reduce the numbers of power devices. As the levels of MLI are increased then in modified circuit only two power devices are to be added for increasing two level. Similarly for increasing the four-levels just add four power devices. For example for five-level MLI six power devices are required, where as for seven-level eight power devices are required and for nine-level ten power devices are required. Figure 3 shows the power circuit of single phase five level CHB-MLI Topology I.

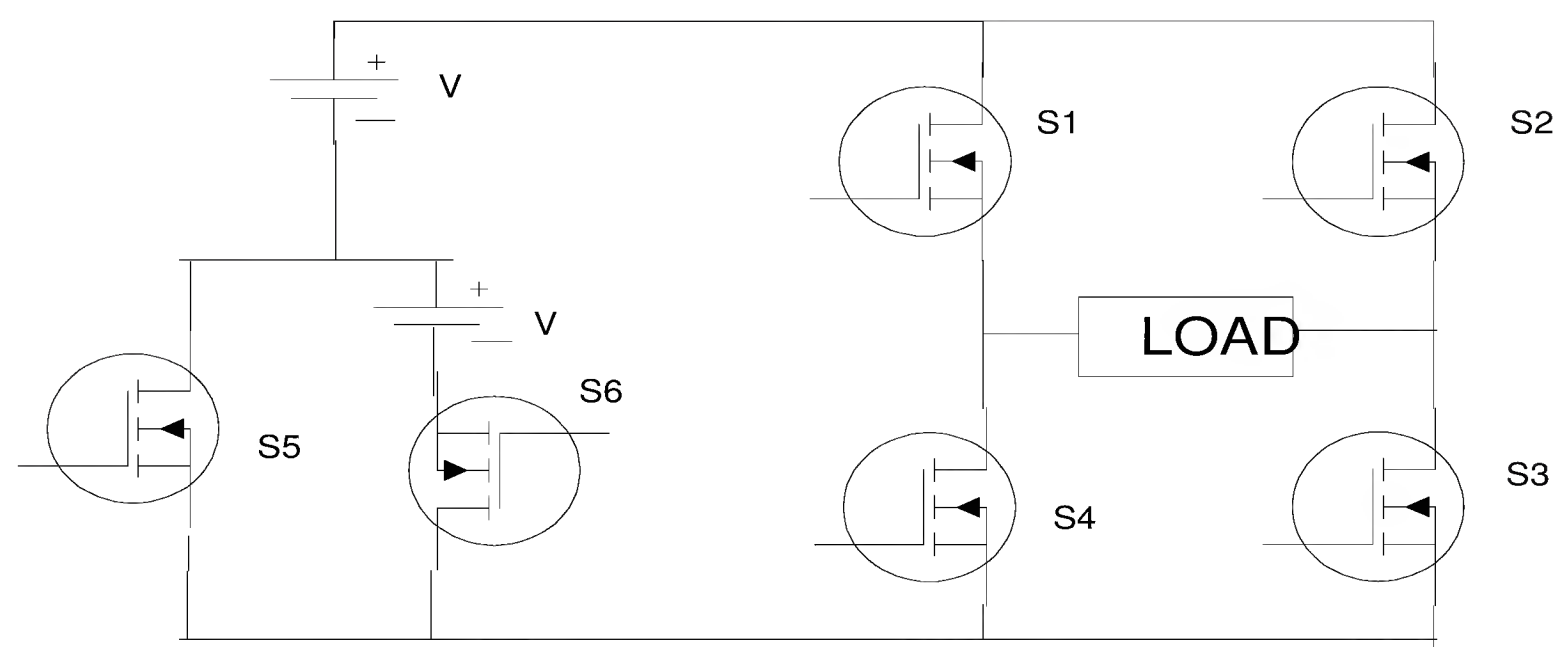

Figure 3: Five Level CHB-MLI Topology I

The switching of the power devices to obtain the same output voltage waveform as shown in Figure 2 is tabulated in Table 2.

Table 2: Switching Table of the Five Level CHB-MLI Topology I

S. No.	Stage	Status of the Power Device					
		S ₁	S ₂	S ₃	S ₄	S ₅	S ₆
1.	2 nd (+) ^{ve}	1	0	1	0	0	1
2.	1 st (+) ^{ve}	1	0	1	0	1	0
3.	0	0	0	0	0	0	0
4.	1 st (-) ^{ve}	0	1	0	1	1	0
5.	2 nd (-) ^{ve}	0	1	0	1	0	1

CASCADED H-BRIDGE MULTILEVEL INVERTER - TOPOLOGY II

In topology II the conventional CHB-MLI is modified with the objective to further reduce the numbers of power devices. As the three level inverter is increased to five level inverter then two additional switches are required, but after fifth level by increasing two levels only one more switch is required. For example for three-level MLI four power devices are required, where as for five-level six power devices are required, for seven-level seven power devices are required and for nine-level eight power devices are required. Figure 4 shows the power circuit of single phase five level CHB-MLI Topology II.

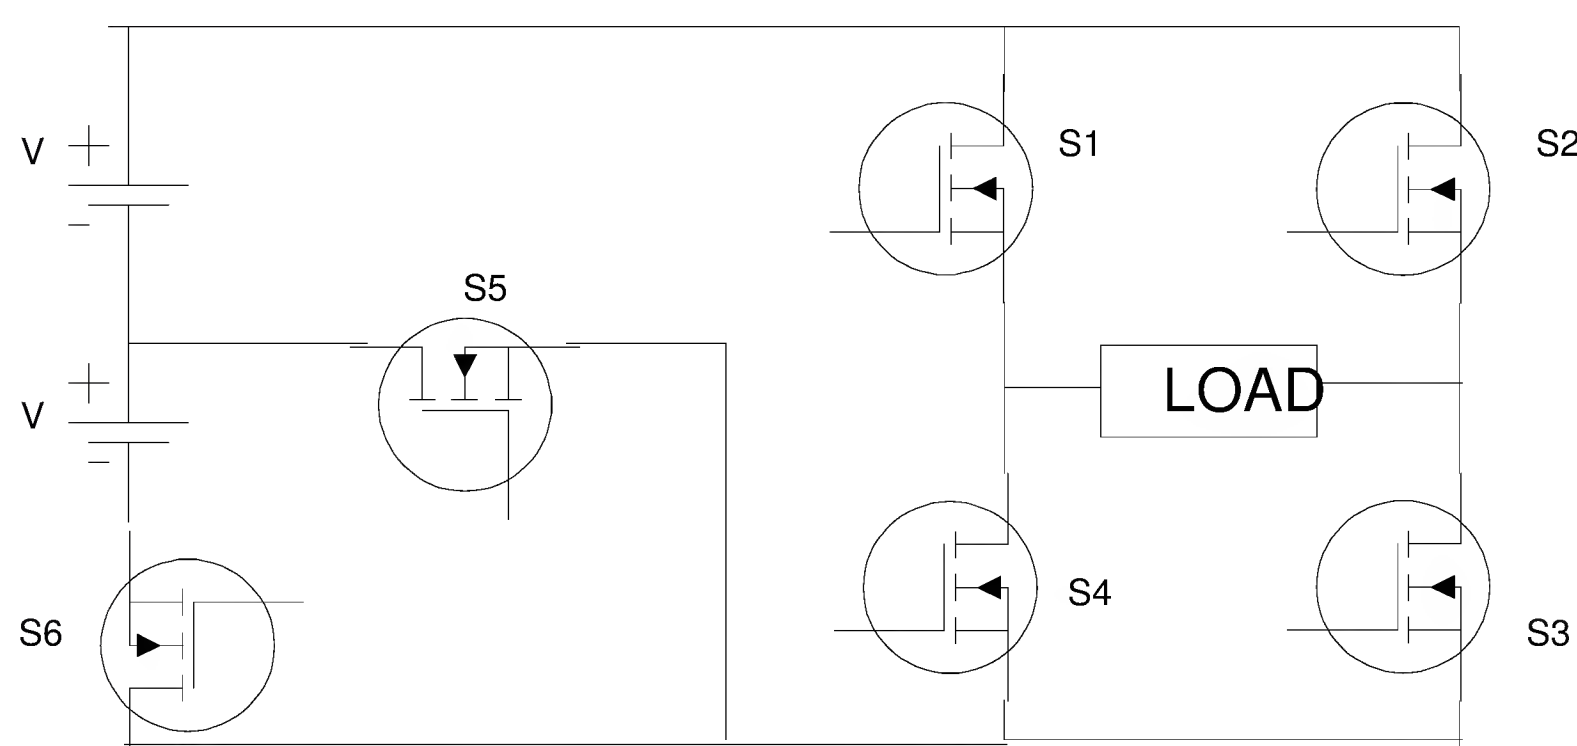

Figure 4: Five Level CHB-MLI Topology II

The switching of the power devices to obtain the same output voltage waveform as shown in Figure 2 is tabulated in Table 3.

Table 3: Switching Table of the Five Level CHB-MLI Topology II

S. No.	Stage	Status of the Power Device					
		S ₁	S ₂	S ₃	S ₄	S ₅	S ₆
1.	2(+) ^{ve}	1	0	1	0	0	1
2.	1(+) ^{ve}	1	0	1	0	1	0
3.	0	0	0	0	0	0	0
4.	1(-) ^{ve}	0	1	0	1	1	0
5.	2(-) ^{ve}	0	1	0	1	0	1

SIMULATION RESULTS

The SIMULINK models of the five level conventional CHB-MLI, CHB-MLI topology I and CHB-MLI topology II are shown in Figure 5, Figure 6, Figure 7 respectively and the output voltage waveform obtained is same for all the topologies as shown in Figure 8. The SIMULINK models were made for seven level and nine level conventional CHB-MLI and it is observed that the THD reduces as the level increases. The output voltage waveforms of seven and nine level MLIs are shown in Figure 9 and Figure 10 respectively. THD with reference to fundamental component for five, seven and nine levels are shown in Figure 11, Figure 12 and Figure 13 respectively.

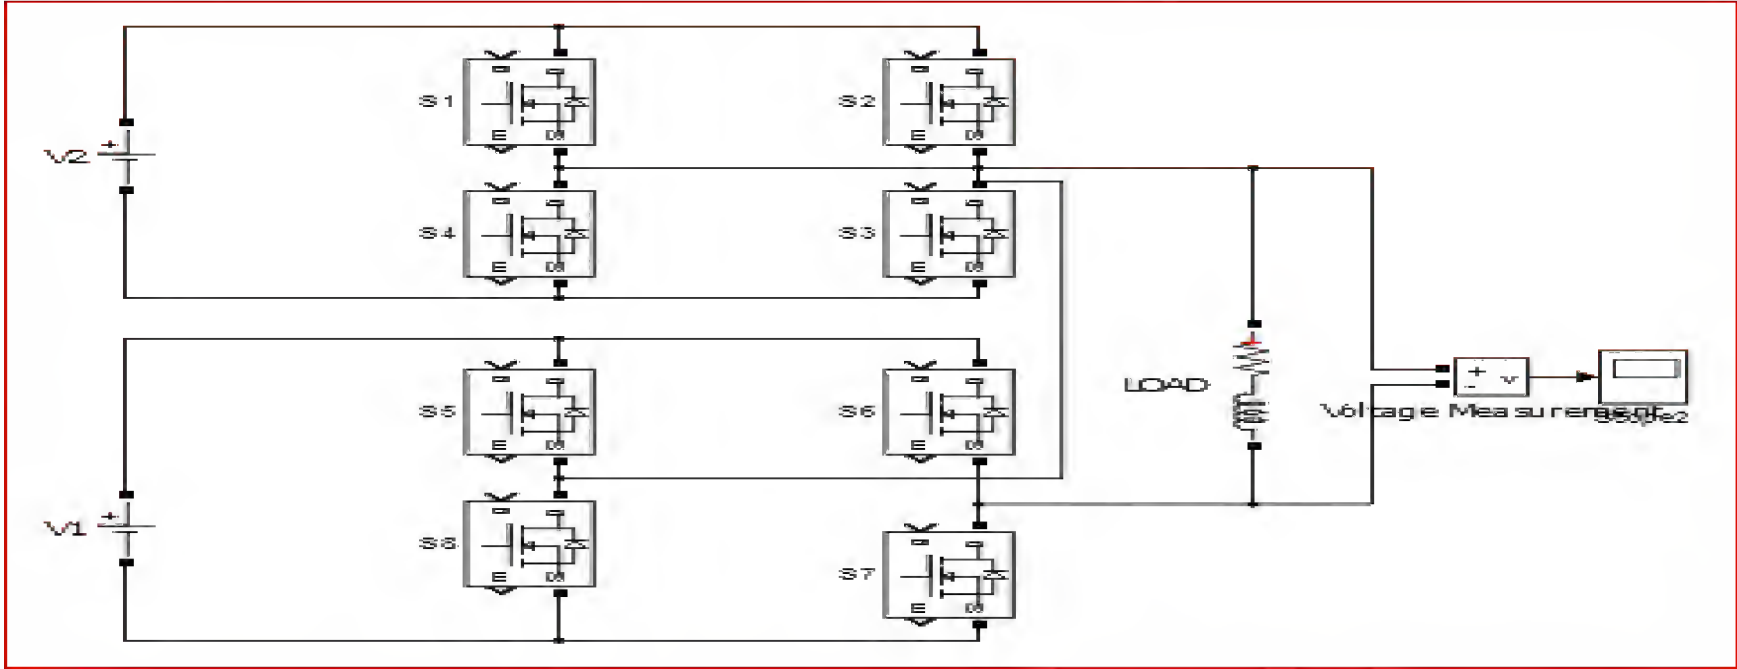

Figure 5: SIMULINK Model of Conventional Five Level CHB-MLI

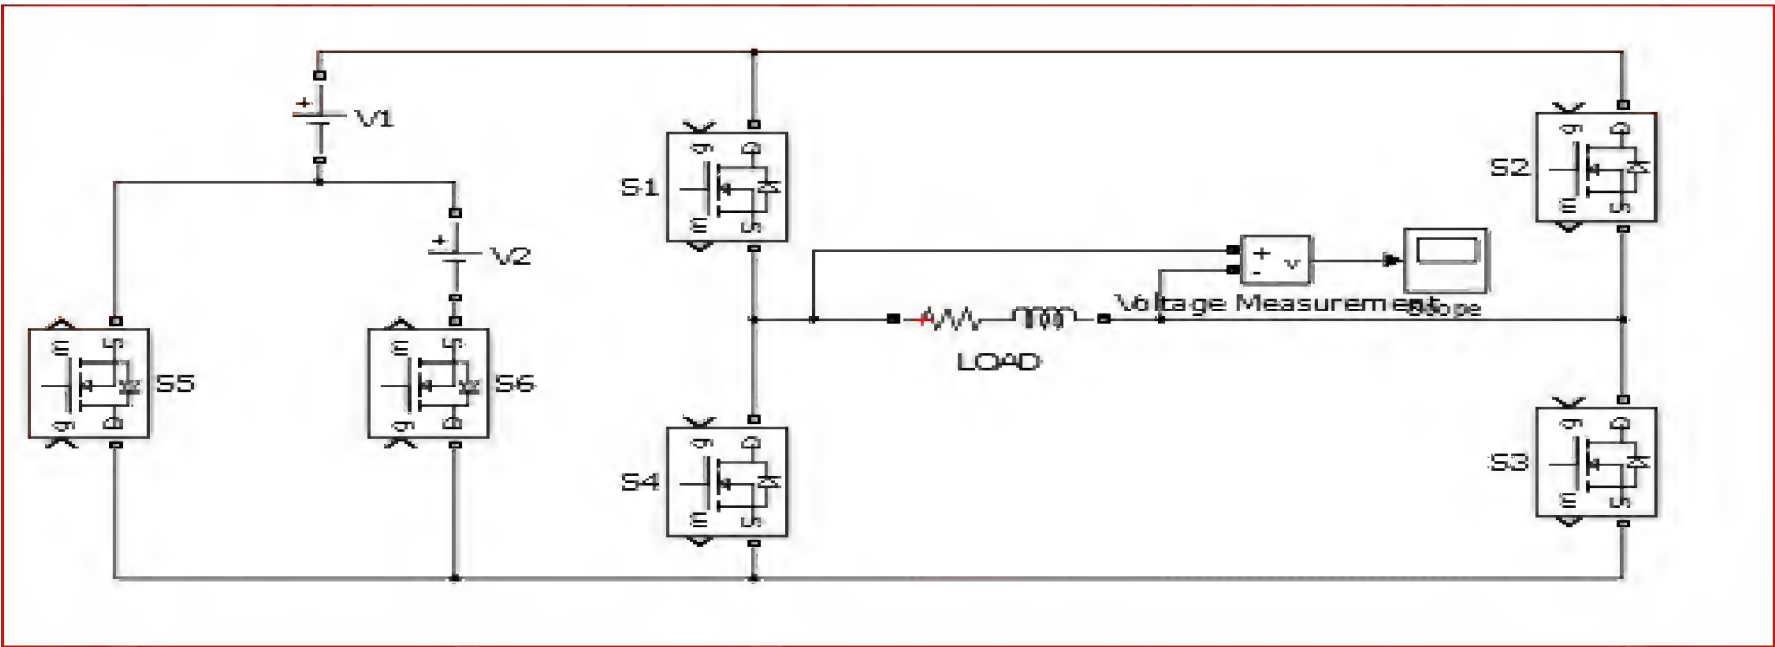

Figure 6: SIMULINK Model of Five Level CHB-MLI Topology I

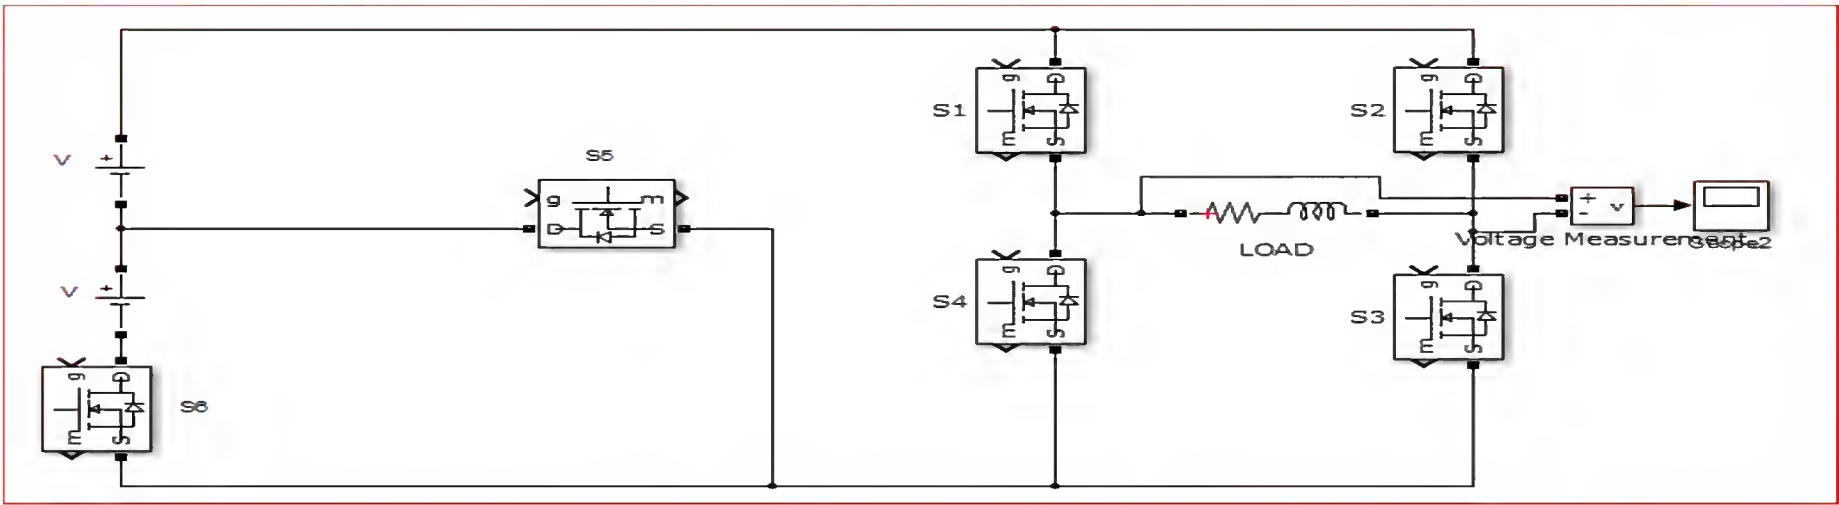

Figure 7: SIMULINK Model of Five Level CHB-MLI Topology II

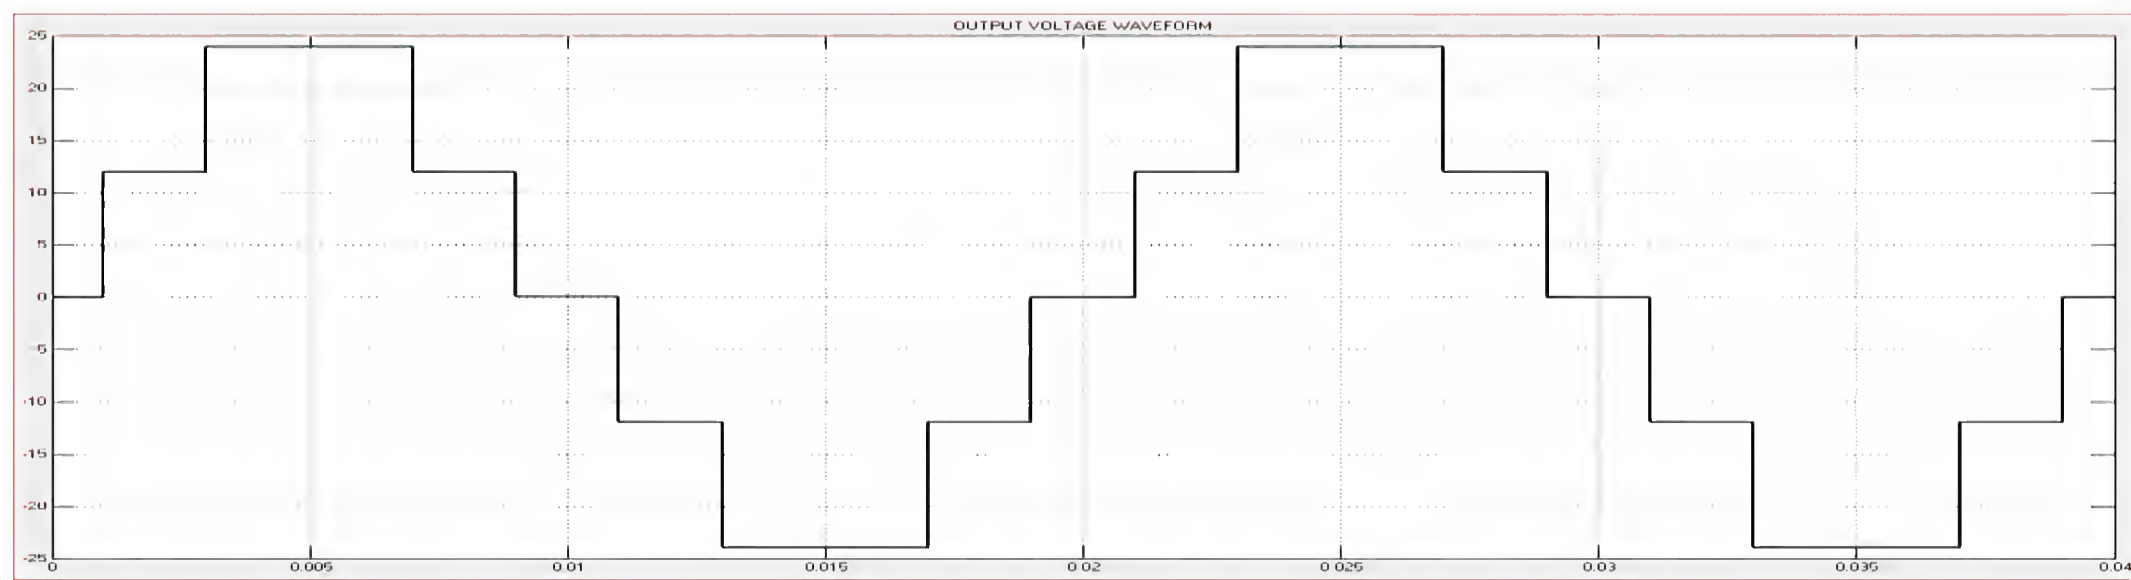

Figure 8: Output Waveform of a Five Level MLI

Figure 9: Output Waveform of a Seven Level MLI

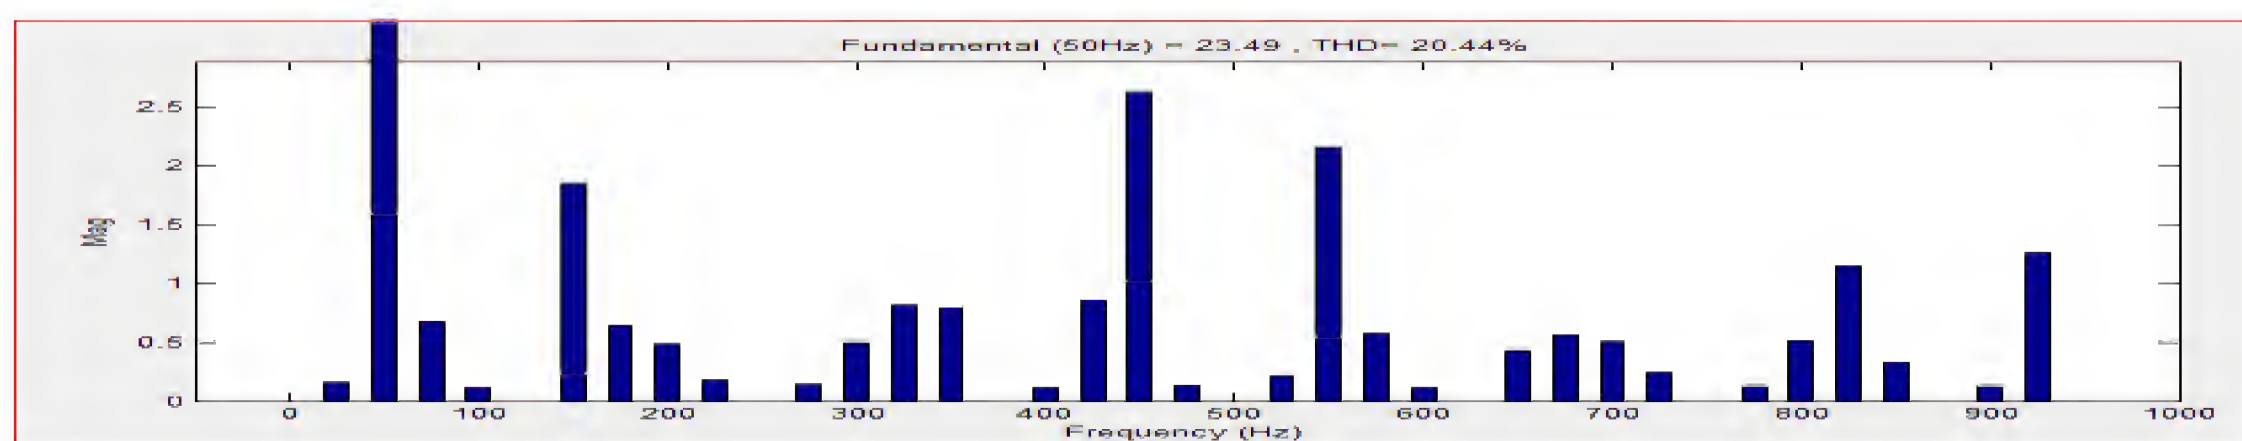

Figure 11: THD with Reference to Fundamental Component of a Five Level MLI

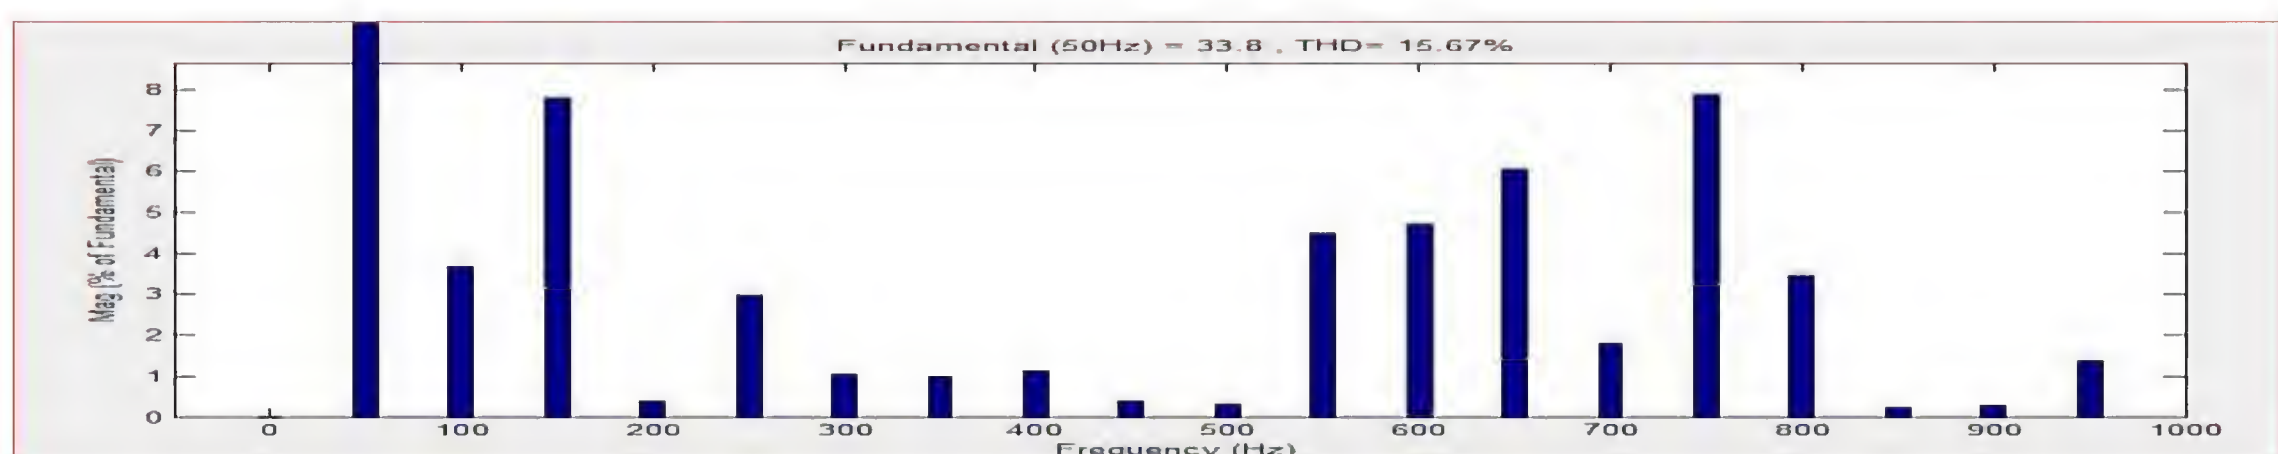

Figure 12: THD with Reference to Fundamental Component of a Seven Level MLI

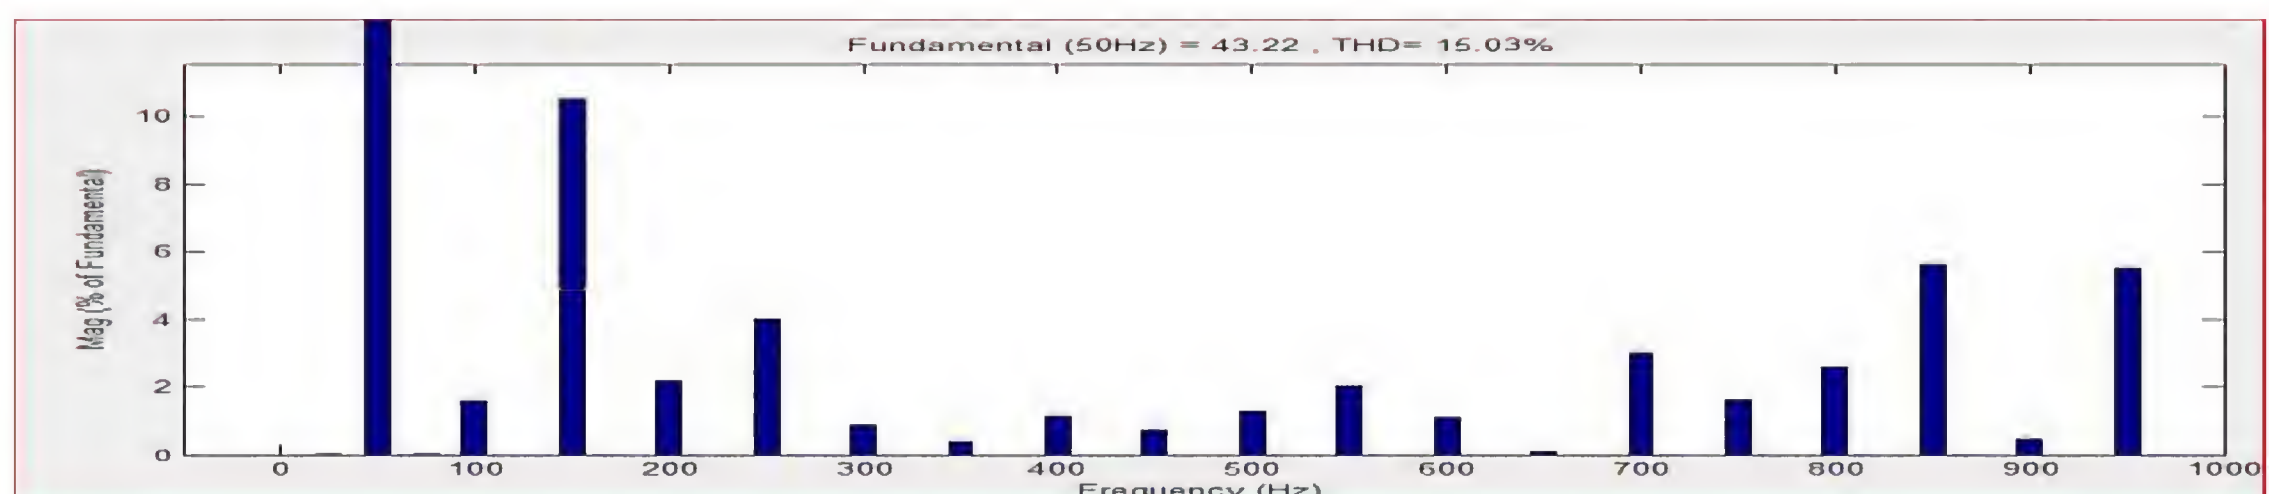

Figure 13: THD with Reference to Fundamental Component of a Nine Level MLI

The SIMULINK models were made for seven level and nine level CHB-MLI topology-I as shown in Figure 14(a) and Figure 14(b) respectively and it is observed that the same output is achieved with same THD as obtained for the conventional CHB-MLI but with reduced number of switches.

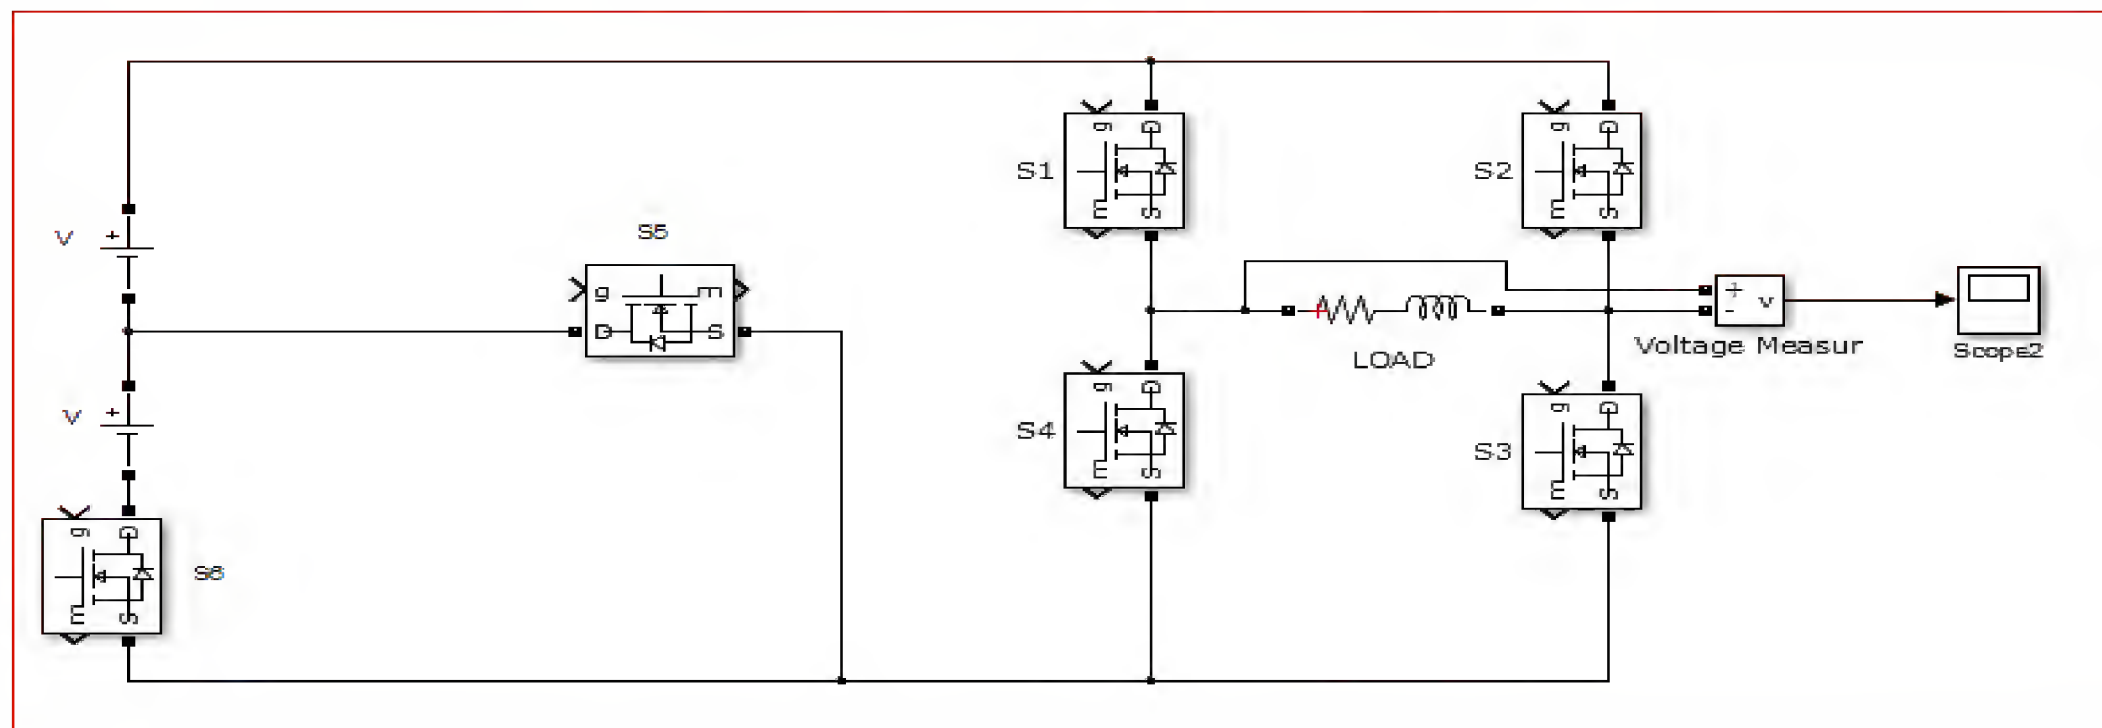

Figure 14a: SIMULINK Model of Seven Level CHB-MLI Topology I

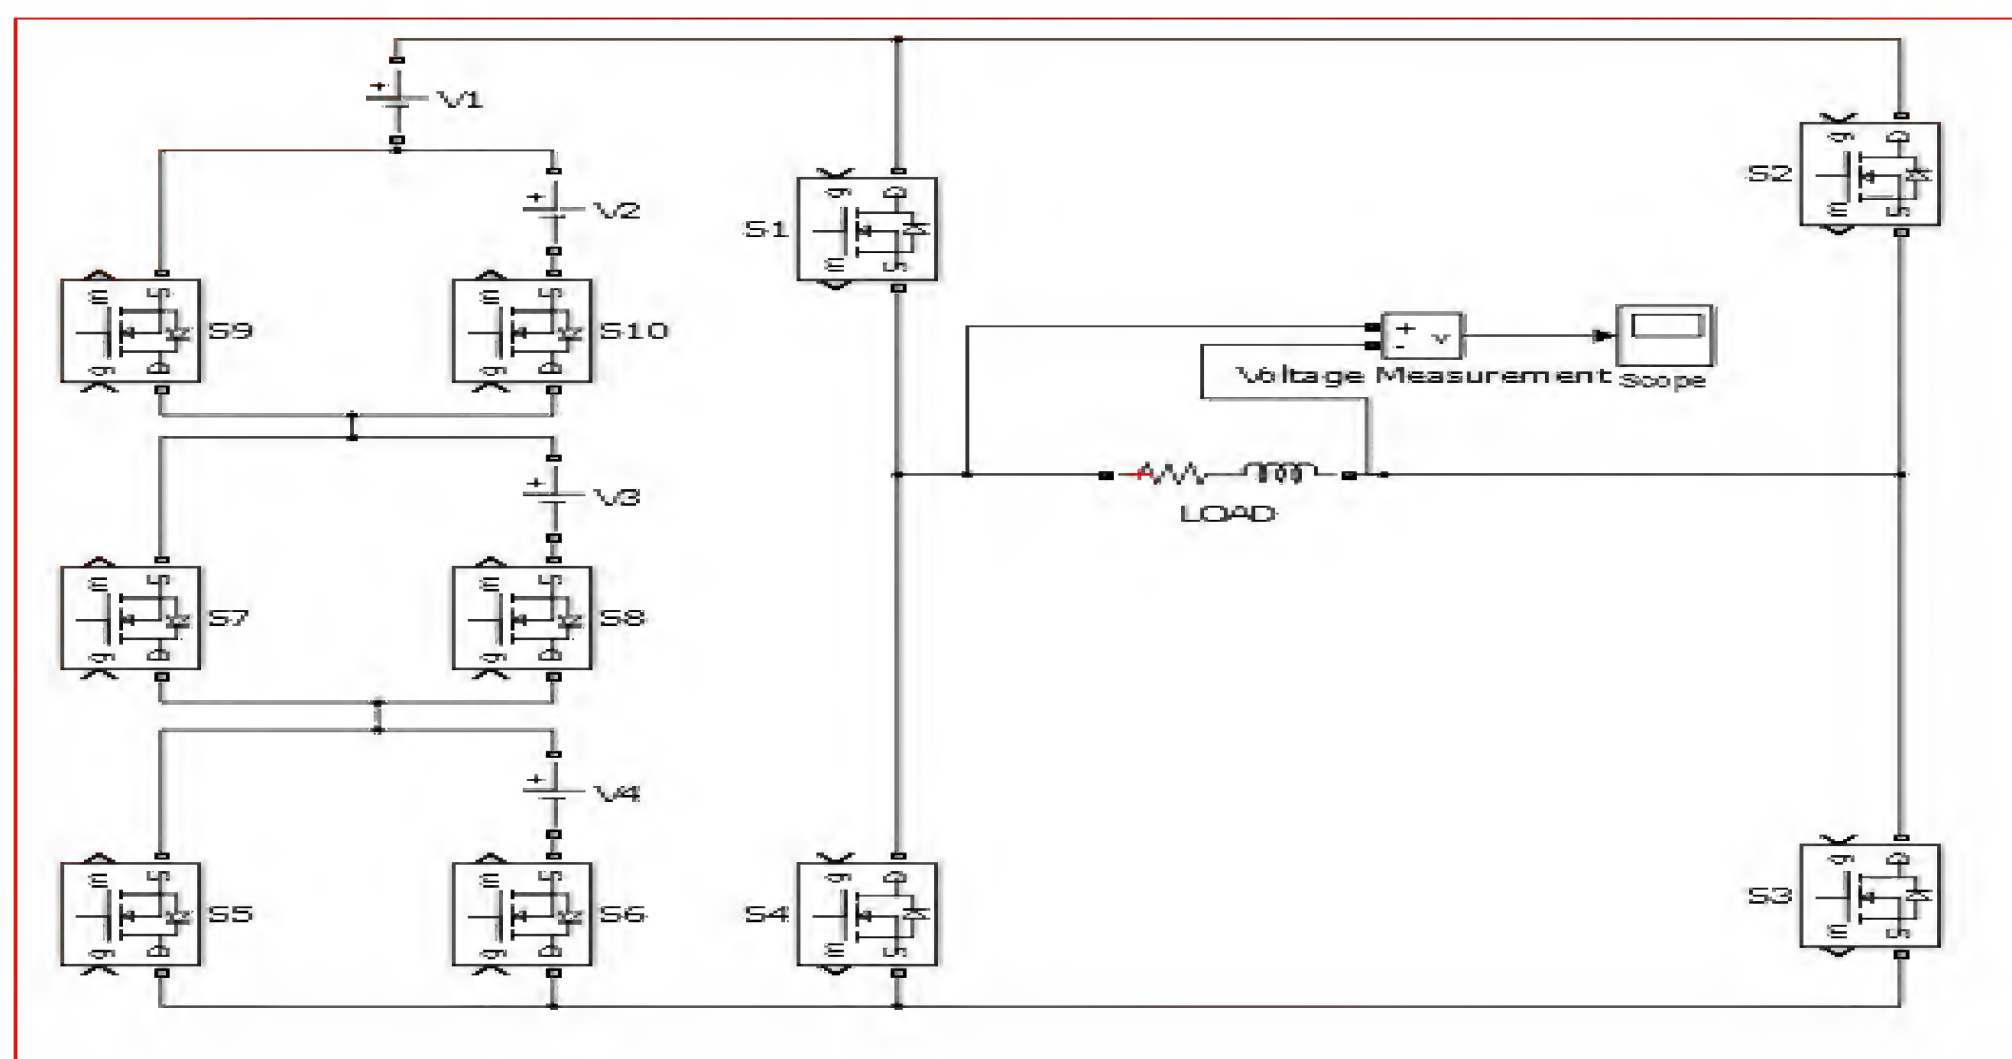

Figure 14b: SIMULINK Model of Nine Level CHB-MLI Topology I

The SIMULINK models were made for seven level and nine level CHB-MLI topology-II as shown in Figure 15(a) and Figure 15(b) respectively and it is observed that again the same output is achieved with same THD as obtained for the conventional CHB-MLI but with still reduced number of switches for higher levels.

COMPARATIVE ANALYSIS

The comparison of number of power devices required for conventional CHB-MLI, Topology I and Topology II for five level, seven level and nine level are tabulated in Table 4. It can be depicted that Topology II is best suited with reference to number of power devices required.

Table 4: Comparison of Number of Devices

MLI Topology	Number of Devices		
	5 Level	7 Level	9 Level
Conventional CHB	8	12	16
Topology I	6	8	10
Topology II	6	7	8

The basic switching strategy for five level inverter is $(\alpha - \alpha - 2\alpha - \alpha - \alpha)$, where α is the angle for the duration for which the output voltage is zero in the first state. The THD with this particular strategy is quite high. In order to reduce the THD, the switching strategy of $(\alpha - 2\alpha - 4\alpha - 2\alpha - \alpha)$ is used and same strategies used for seven and nine level too. The switching strategy used in five, seven and nine level are tabulated in Table 5.

Table 5: Switching Strategies

Level	Switching Strategy	α in Degrees
5	$\alpha - 2\alpha - 4\alpha - 2\alpha - \alpha$	18
7	$\alpha - 2\alpha - 2\alpha - 4\alpha - 2\alpha - 2\alpha - \alpha$	12.86
9	$\alpha - 2\alpha - 2\alpha - 2\alpha - 4\alpha - 2\alpha - 2\alpha - 2\alpha - \alpha$	10

The THD is calculated for conventional CHB-MLI, Topology I and Topology II for five level, seven level and nine level and is tabulated in Table 6. It is observed that THD reduces as the number of level increases but is same for all the Topologies as the same control strategy is used.

Table 6: Comparison of THD

MLI Topology	THD in %		
	5 Level	7 Level	9 Level
Conventional CHB	20.44	15.67	15.03
Topology I	20.44	15.67	15.03
Topology II	20.44	15.67	15.03

The maximum voltage across the device either in forward blocking mode or reverse blocking mode is called as the maximum voltage stress. The average voltage stress across the device is calculated based on the stress on the device in one cycle. The voltage stress on each power device is calculated for all the three Topologies. In conventional CHB-MLI the maximum voltage stress on each power device is the D.C cell voltage and the average voltage stress on device varied based on the switching times. Table 7, Table 8 and Table 9 shows Average Voltage Stress across each device of convention CHB-MLI, topology I and topology II for five level, seven level and nine levels respectively. For five level MLI, the average voltage stress on each device in Topology I and Topology II is same and which is more than the Conventional CHB-MLI.

Table 7: Comparison of Average Voltage Stress for 5 Level

MLT Topology	Average Voltage Stress in Volts							
	S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	S ₇	S ₈
Conventional CHB	6	6	6	6	6	6	6	6
Topology I	8.4	8.4	8.4	8.4	4.8	4.8	-	-
Topology II	8.4	8.4	8.4	8.4	4.8	4.8	-	-

Table 8: Comparison of Average Voltage Stress for 7 Level

MLT Topology	Average Voltage Stress in Volts											
	S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	S ₇	S ₈	S ₉	S ₁₀	S ₁₁	S ₁₂
Conventional CHB	7.714	7.714	7.714	7.714	7.714	7.714	7.714	7.714	7.714	7.714	7.714	7.714
Topology I	11.145	11.145	11.145	11.145	5.13	5.13	5.13	5.13	-	-	-	-
Topology II	11.145	11.145	11.145	11.145	6.86	6.86	6.86	-	-	-	-	-

In seven level MLI, the average voltage stress on bridge devices in topology I and Topology II is same but on other devices in Topology I and Topology II the voltage stress is less as compared to conventional Cascade H-Bridge Topology. In nine level also the average voltage stress on bridge devices in topology I and Topology II is same but on other devices in Topology II the voltage stress is more and which is very close to the voltage stress on conventional Cascade H-Bridge Topology.

Table 9: Comparison of Average Voltage Stress for 9 Level

MLT Topology	Average Voltage Stress in Volts															
	S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	S ₇	S ₈	S ₉	S ₁₀	S ₁₁	S ₁₂	S ₁₃	S ₁₄	S ₁₅	S ₁₆
Conv. CHB	8.67	8.67	8.67	8.67	7.33	7.33	7.33	7.33	7.33	7.33	7.33	7.33	8.67	8.67	8.67	8.67
Topology I	14	14	14	14	5.3	5.3	5.3	5.3	5.3	5.3	5.3	-	-	-	-	-
Topology II	14	14	14	14	8	8	8	8	-	-	-	-	-	-	-	-

The Maximum Voltage Stress across each device of convention CHB-MLI, topology I and topology II for five level, seven level and nine levels is tabulated in Table 10, Table 11 and Table 12 respectively. It is quite clear that in Topology I and Topology II the maximum voltage stress is more than the conventional CHB-MLI.

Table 10: Comparison of Maximum Voltage Stress for 5 Level

Topology I	48	48	48	48	12	12	12	12	12	12	12	-	-	-	-	-
Topology II	48	48	48	48	12	12	12	12	-	-	-	-	-	-	-	-

The utilization factor for individual device is calculated based on the conduction period of that device in one cycle. The utilization factor of each device for convention CHB-MLI, topology I and topology II for five level, seven level and nine levels is tabulated in Table 13, Table 14 and Table 15 respectively. In seven and nine level MLI, the Utilization factor of the devices is increased in Topology I and Topology II.

Table 13: Comparison of Utilization Factor for 5 Level

MLT Topology	Utilization Factor of Device							
	S ₁	S ₂	S ₃	S ₄	S ₅	S ₆	S ₇	S ₈
Conventional CHB	0.4	0.4	0.4	0.4	0.4	0.4	0.4	0.4
Topology I	0.4	0.4	0.4	0.4	0.4	0.4	-	-

CONCLUSIONS

In this paper a detailed comparison of conventional CHB-MLI and cascaded H-Bridge MLI Topology I and Topology II has been presented. The reduction in the number of devices goes on increasing as we increase the number of levels for topology-II. The Topology I and II are more cheaper and efficient than the conventional because number of conducting power devices are less. Maximum voltage stress on each device in conventional CHB-MLI is V , where as in topology I and topology II voltage stress increases with increase in the number of levels. The cost of Topology I and Topology II are lower than the conventional CHB-MLI. Utilization factor is increased in Topology I and Topology II as compared to the conventional topology. The average voltage stress on devices in the basic bridge is more for Topology I and II while for other switches the average voltage stress is less. By properly choosing the control strategy, the utilization factor for each device can be increased and at the same time the THD and the average voltage stress can also be reduced.
